

Features

- High gain bandwidth : 1.1MHz
- Rail-to-rail input and output 0.8mV typical
 V_{OS}
- Input voltage range : -0.1V to +5.6V with
 $V_S = 5.5V$
- Supply range : +2.5V to +5.5V
- Shutdown : CBMV321S/CBMV358S
- Specified up to +125°C
- Micro size packages : SOT23-5, SOT23-6

Application

- Sensors
- Photo diode Amplification
- Active Filters
- Test Equipment
- Driving A/D Converters

Description

The CBMV321, CBMV358, CBMV324, CBMV321S, CBMV358S families of products offer low voltage operation and rail-to-rail input and output, as well as excellent speed/power consumption ratio, providing an excellent bandwidth (1.1MHz) and slew rate of 0.5V/us. The op-amps are unity gain stable and feature an ultra-low input bias current.

The devices are ideal for sensor interfaces, active filters and portable applications. The CBMV321S, CBMV358S include a shutdown mode. Under logic control, the amplifiers can be switched from normal operation to a standby current that is less than 1uA. The CBMV321, CBMV358, CBMV324, CBMV321S, CBMV358S families of operational amplifiers are specified at the full temperature range of -40°C to +125°C under single or dual power supplies of 2.5V to 5.5V.

1.Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those specified is not implied.

2.Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5V beyond the supply rails should be current-limited to 10mA or less.

ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

Application Notes

The CBMV321, CBMV358, CBMV324, CBMV321S, CBMV358S are high precision, rail-to-rail operational amplifiers that can be run from a single-supply voltage 2.5V to 5.5V ($\pm 1.25V$ to $\pm 2.75V$). Supply voltages higher than 7V (absolute maximum) can permanently damage the amplifier.

Rail-to-rail input and output swing significantly increases dynamic range, especially in low-supply applications.

Good layout practice mandates use of a 0.1 μ F capacitor place closely across the supply pins.

CBMV321S/CBMV358S Enable Function

The CBMV321S/CBMV358S includes a shutdown mode. Under logic control, the amplifiers can be switched from normal mode to a standby current of 1 μ A. When the Enable pin is connected to high, the amplifier is active. Connecting Enable low disables the amplifier, and places the amplifier, and place the output in a high-impedance state.

Layout Guidelines

Attention to good layout practices is always recommended. Keep traces short. When possible, use a PCB ground plane with surface-mount components placed as close to the device pins as possible. Place a 0.1uF capacitor closely across the supply pins.

These guidelines should be applied throughout the analog circuit to improve performance and provide benefits such as reducing the EMI susceptibility.
